Build the sjSDM CV Calibration Budget Ladder

Description

Constructs the fixed iteration ladder at the configured screening sampling followed by the maximum-iteration sampling ladder used only when iteration calibration fails.

Usage

```
build_sjsdm_cv_calibration_ladder(iteration_sampling = 100L)
```

Arguments

`iteration_sampling`	Positive integer sampling budget used for the iteration-screening rungs.

Value

Tibble with deterministic budget order, phase, iterations, and sampling.

Examples

```
build_sjsdm_cv_calibration_ladder()
```
