Make sjSDM Tuning Branch Work Items

Description

Converts public tuning work items into a branchable table. Empty inputs produce one explicit non-fitting sentinel so 'targets' does not branch over an empty target.

Usage

```
build_sjsdm_tuning_branch_work_items(data_work_items = NULL)
```

Arguments

`data_work_items`	Work-item table returned by [build_sjsdm_tuning_work_items()]. It may be empty when cross-validation is scientifically inapplicable.

Value

Work-item tibble with additive 'tuning_applicable'. Non-empty inputs retain every row and set the flag to 'TRUE'; empty inputs return one typed sentinel row with the flag set to 'FALSE'.

Examples

```
## Not run:

build_sjsdm_tuning_branch_work_items(

  data_work_items = data_sjsdm_tuning_work_items

)

## End(Not run)
```
