Build Trait Review Candidates

Description

Builds an auditable taxon-by-domain review queue from within-taxon trait outlier flags, objective invalid values, and optional source review keys. Domain-level flags remain diagnostic and do not create candidates alone.

Usage

```
build_trait_review_candidates(
  data_trait_records,
  data_source_candidates = NULL,
  review_stage = "raw",
  domain_iqr_multiplier = 3,
  taxon_iqr_multiplier = 1.5,
  minimum_taxon_records = 10L
)
```

Arguments

`data_trait_records`	Trait records containing 'taxon_name', 'trait_domain_name', and 'trait_value'.
`data_source_candidates`	Optional data frame containing 'taxon_name', 'trait_domain_name', and 'source_reference' from an external review source.
`review_stage`	Character scalar: either '"raw"' or '"classified"'.
`domain_iqr_multiplier`	Positive numeric domain-level IQR multiplier. Default: '3'.
`taxon_iqr_multiplier`	Positive numeric within-taxon IQR multiplier. Default: '1.5'.
`minimum_taxon_records`	Positive integer minimum group size. Default: '10L'.

Value

A tibble with one row per review candidate and a stable SHA-256 'candidate_id'.
