Compute Interpolation on an Age Grid

Description

Computes interpolated values on a regular age grid for one numeric series.

Usage

```
.compute_interpolation_on_age_grid(
  data_time_series_group,
  age_variable_name,
  value_variable_name,
  interpolation_method,
  extrapolation_rule,
  ties_function,
  age_min,
  age_max,
  time_step
)
```

Arguments

`data_time_series_group`	A data frame containing one age column and one value column.
`age_variable_name`	Name of the numeric age column.
`value_variable_name`	Name of the numeric value column.
`interpolation_method`	Interpolation method passed to [stats::approx()].
`extrapolation_rule`	Numeric extrapolation rule passed to [stats::approx()].
`ties_function`	Function used by [stats::approx()] to combine tied ages.

`age_min`	Minimum age in the output grid.
`age_max`	Maximum age in the output grid.
`time_step`	Positive spacing between consecutive ages in the output grid.

Value

A tibble containing the interpolated age and value columns.
