Compute Predictive Decomposition Shares

Description

Converts full and reduced predictive losses into fold-level decomposition shares for abiotic predictors, spatial predictors, and species associations.

Usage

```
compute_predictive_decomposition_shares(data_fold_metrics)
```

Arguments

`data_fold_metrics`	Data frame with columns 'repeat_id', 'fold_id', 'variant', and 'loss'. A 'status' column is optional; when present, only rows with status '"ok"' are used.

Value

A tibble with one row per repeat, fold, and component.
