Diagnose the sjSDM GPU Runtime

Description

Performs a non-aborting diagnostic of the Python, torch, and CUDA runtime used by sjSDM. Strict GPU-only workflows should call 'validate_sjsdm_gpu_runtime()'.

Usage

```
diagnose_sjsdm_gpu_runtime(verbose = TRUE)
```

Arguments

`verbose` Logical. If 'TRUE' (default), progress and diagnostics are printed.

Details

This diagnostic always returns a result. Missing requirements are represented by false or missing fields rather than an abort.

Value

A named list with diagnostic fields, including success flags, torch version, CUDA version, and GPU names.
