Diagnose Trait Source Anomalies

Description

Prioritises multiplicative source-taxon unit anomalies using positive trait medians, independent-source agreement, and robust domain-level log ranges. The findings are diagnostic and never modify or approve corrections.

Usage

```
diagnose_trait_source_anomalies(
  data_trait_records,
  source_factor_relative_tolerance = 0.25,
  minimum_log10_gap = 0.75,
  outlier_fence_multiplier = 3
)
```

Arguments

`data_trait_records`	Long trait records retaining taxon, source, domain, and value columns.
`source_factor_relative_tolerance`	Maximum relative distance from the nearest power-of-ten factor.
`minimum_log10_gap`	Minimum absolute source comparison gap.
`outlier_fence_multiplier`	Non-negative domain log-IQR multiplier.

Value

A named list containing 'data_source_taxon_summary', 'data_source_anomalies', and 'data_domain_summary'.

Examples

```
diagnose_trait_source_anomalies(
  tibble::tibble(
    taxon_name = c("A", "A"),
```

```
    data_source_id = c(1L, 2L),
    trait_domain_name = "Stem specific density",
    trait_value = c(0.0003, 0.3)
  )
)
```
