Evaluate Binary Brier Score

Description

Calculates the mean squared error between binary observations and predicted probabilities.

Usage

```
evaluate_binary_brier_score(observed = NULL, predicted_probability = NULL)
```

Arguments

`observed`	Numeric binary observation vector.
`predicted_probability`	Numeric predicted-probability vector aligned with 'observed'.

Value

One-row tibble containing 'brier_score', 'metric_status', observation counts, and prevalence. Valid one-class inputs retain a finite Brier score because this metric does not require both classes.

Examples

```
evaluate_binary_brier_score(
  observed = c(0, 1),
  predicted_probability = c(0.25, 0.75)
)
```
