Get New Targets Errors

Description

Compares 'targets' error metadata before and after a pipeline run and returns errors newly recorded or retried by that run.

Usage

```
extract_new_target_errors(data_errors_before = NULL, data_errors_after = NULL)
```

Arguments

`data_errors_before`	Error metadata captured before execution.
`data_errors_after`	Error metadata captured after execution.

Value

A tibble of new error records with 'name', 'error', and 'time' columns. Direct target errors precede cascading dependency-load errors while the original order is retained within both groups.
