Fit Hierarchical Clustering from a Distance Matrix

Description

Fits a hierarchical clustering model from a precomputed dissimilarity matrix using 'stats::hclust()'.

Usage

```
fit_hierarchical_clustering(trait_dissimilarity, clustering_method = "ward.D2")
```

Arguments

`trait_dissimilarity`	A '"dist"' object (as produced by 'compute_trait_dissimilarity()' or 'stats::as.dist()'). Must contain no 'NA' or non-finite values.
`clustering_method`	A single character string passed to 'stats::hclust()' as the 'method' argument. Default: '"ward.D2"'. See '?stats::hclust' for all valid linkage methods.

Value

An object of class '"hclust"' as returned by 'stats::hclust()'.
