Interpolate One Fossil Age-Iteration Batch

Description

Expands one fossil community dataset across selected age-model iterations and interpolates each taxon-iteration series on a shared age grid.

Usage

```
.interpolate_fossil_age_iteration_batch(
  vec_iterations,
  dataset_name,
  data_community,
  data_age_uncertainty,
  list_interpolation_arguments,
  interpolate_grouped_time_series_function
)
```

Arguments

`vec_iterations`	Integer age-model iterations included in the batch.
`dataset_name`	Dataset identifier restored after joining the nested community records.
`data_community`	Nested community proportions with 'sample_name', 'taxon', and 'value'.
`data_age_uncertainty`	Nested age-model records with 'sample_name', 'iteration', and 'age_uncertainty'.
`list_interpolation_arguments`	Additional arguments forwarded to [interpolate_grouped_time_series()].
`interpolate_grouped_time_series_function`	Grouped interpolation function supplied explicitly for dependency-safe execution inside a dynamic target branch.

Value

Interpolated community proportions for every selected age-model iteration.
