Load Value from Active Configuration

Description

Loads one nested value from the active project configuration.

Usage

```
load_active_config_value(value, file = here::here("config.yml"))
```

Arguments

`value` A character vector specifying the configuration key(s) to retrieve.

`file` Path to the YAML configuration file (default: "config.yml").

Details

The active configuration is set by 'R_CONFIG_ACTIVE'. An unset or empty value uses 'default'. Explicit named access belongs in [load_config()] or [load_config_value()].

Value

The value associated with the specified key path.
