Load Named Configuration

Description

Loads one complete resolved project configuration by its identifier.

Usage

```
load_config(config_id, file = here::here("config.yml"))
```

Arguments

`config_id`	Single non-empty configuration identifier declared in the YAML file.
`file`	Path to the generated YAML configuration file.

Details

Use [load_config_value()] when only one nested configuration value is needed. This function is the canonical project boundary around [config::get()] for complete named configurations.

Value

The complete resolved named configuration.
