Get Model Tuning Parameters

Description

Reads model-fitting parameters for one analysis, spatial unit, and resolution from the model tuning CSV catalogue.

Usage

```
load_model_tuning_parameters(
  analysis_id,
  scale_id,
  resolution_id,
  dir = here::here("Data/Input/Model_tuning"),
  fit_stage = c("final", "cross_validation")
)
```

Arguments

`analysis_id`	A single non-empty character string identifying the analysis family, such as '"paleo_spatial"' or '"modern_spatial"'.
`scale_id`	A single non-empty character string identifying the spatial unit. Must match exactly one row in the selected tuning file.
`resolution_id`	A single character string identifying the model resolution. '"genus"' reads the '*_genus.csv' file, '"family"' reads the '*_family.csv' file, and '"functional_type"', '"ft_paleo"', and '"ft_modern"' read the '*_ft.csv' file.
`dir`	Directory containing model tuning CSV files. Default: 'here::here("Data/Input/Model_tuning")'.
`fit_stage`	Fitting stage to load. '"final"' returns the historical full-data model budget. '"cross_validation"' returns the independent CV fit budget.

Value

A named stage-specific fitting list. Missing step-size and early-stopping values are returned as 'NULL'.
