Collect Available sjSDM Tier Decisions

Description

Discovers consecutive completed staged-round decisions in the isolated tier store. A missing next round is a normal orchestration boundary; errored targets, decision gaps, and malformed existing artifacts abort.

Usage

```
load_sjsdm_available_tier_decisions(
  store_path = NULL,
  data_model_context = NULL,
  n_non_final_rounds = NULL,
  read_meta_function = load_targets_store_metadata,
  read_decision_function = load_sjsdm_tier_survivor_decisions
)
```

Arguments

`store_path`	Character scalar path to the dedicated tier-tuning targets store.
`data_model_context`	One-row model-context table used to select decision rows.
`n_non_final_rounds`	Non-negative integer count of rounds that publish survivor decisions.
`read_meta_function`	Injectable metadata reader compatible with [load_targets_store_metadata()].
`read_decision_function`	Injectable decision reader compatible with [load_sjsdm_tier_survivor_decisions()].

Value

Ordered list of consecutive decision tibbles beginning with round one.
