Load Trait Domain Names from VegVault

Description

Loads all unique trait domain names from the 'TraitsDomain' table.

Usage

```
load_trait_domain_names_from_vegvault(
  path_vegvault = here::here("Data/Input/VegVault.sqlite"),
  verbose = TRUE
)
```

Arguments

`path_vegvault`	A character string specifying the path to the VegVault SQLite database (default: 'here::here("Data/Input/VegVault.sqlite")').
`verbose`	Logical. If 'TRUE' (default), progress messages are printed to the console via 'cli'. Set to 'FALSE' to suppress all console output.

Details

The function performs the following steps:

1. Validates input parameters. 2. Checks the presence of the VegVault SQLite database using 'validate_vegvault_presence()'. 3. Opens a DBI connection to the SQLite database. 4. Queries the 'TraitsDomain' table for distinct 'trait_domain_name' values and collects results. 5. Closes the database connection. 6. Removes 'NA' values from the result. 7. Asserts that at least one domain name was found. 8. Optionally logs the result via 'cli::cli_inform()'. 9. Returns the character vector of domain names.

Value

A character vector of unique, non-'NA' trait domain names found in the 'TraitsDomain' table.
