Plot Bipartite Network Metrics by Age

Description

Creates a faceted line-and-point plot of bipartite community network metrics (e.g. connectance, nestedness, modularity) across time slices (ages). Each metric is shown in its own panel with a free y-axis scale.

Usage

```
plot_network_metrics_by_age(
  data_network_metrics,
  title = NULL,
  subtitle = NULL
)
```

Arguments

`data_network_metrics`	A data frame or tibble with columns `age` (numeric), `metric` (character), and `value` (numeric). Typically the output of `compute_network_metrics()` aggregated across time slices and with the age column already parsed to numeric.
`title`	Optional character string for the plot title. Defaults to `NULL` (no title).
`subtitle`	Optional character string for the plot subtitle. Defaults to `NULL` (no subtitle).

Details

The x-axis is reversed so that older ages appear on the left. Each metric is shown in a separate facet panel with an independent y-axis scale (`scales = "free_y"`) because connectance, nestedness, and modularity occupy different numeric ranges. Each panel shows a coloured line with points.

Value

A `ggplot` object.
