Plot Variance Component Triangle Legend

Description

Draws a ternary colour legend for three variance components. Each triangle corner represents the maximum value for one component, and interior points are coloured by the blended component shares.

Usage

```
plot_variance_component_triangle_legend(
  vec_component_colours,
  vec_required_components = base::c("Abiotic", "Spatial", "Associations"),
  vec_component_labels = vec_required_components,
  max_component_value = 100,
  component_step = 2,
  plot_title = NULL,
  font_family = NULL,
  label_colour = "grey35",
  title_colour = label_colour,
  border_colour = "grey35",
  background_colour = "transparent",
  point_size = 2.3,
  label_size = 3.2,
  title_size = 10,
  triangle_x_offset = 0.16,
  method = base::c("perc_avg", "HCL")
)
```

Arguments

`vec_component_colours`	Named character vector mapping component IDs to HEX colours.

`vec_required_components`	Character vector with exactly three component IDs. These IDs are used to read colours from 'vec_component_colours'.
`vec_component_labels`	Character vector with exactly three display labels. Defaults to 'vec_required_components'.
`max_component_value`	Numeric scalar giving the value represented at each triangle corner. Defaults to '100'.
`component_step`	Numeric scalar giving the grid step used to fill the triangle.
`plot_title`	Optional character scalar shown as the plot title.
`font_family`	Optional character scalar giving the font family for labels.
`label_colour`	Character vector giving the corner-label colour. Must have length '1' for one shared colour or length '3' for one colour per label. If length '3' and named, names are matched to 'vec_required_components'; otherwise colours are used in order.
`title_colour`	Character scalar giving the title colour.
`border_colour`	Character scalar giving the triangle-border colour.
`background_colour`	Character scalar giving the plot background colour.
`point_size`	Numeric scalar giving the size of interior colour points.
`label_size`	Numeric scalar giving the size of corner labels.
`title_size`	Numeric scalar giving the size of the optional title.
`triangle_x_offset`	Numeric scalar shifting the triangle horizontally.
`method`	Character string selecting the colour-mixing method passed to [compute_variance_component_colours()].

Value

A 'ggplot' object.
