Replace Missing Community Counts with Zeros

Description

Replaces missing values in wide taxon-count columns with zeros.

Usage

```
replace_missing_community_counts_with_zeros(data_community = NULL)
```

Arguments

`data_community`	A wide data frame containing 'dataset_name', 'sample_name', and at least one taxon-count column.

Details

Identifier columns are preserved without modification. Taxon columns must be numeric because zero represents an observed absence.

Value

The input data frame with missing taxon counts replaced by zeros.

Examples

```
data_community <-

  tibble::tibble(

    dataset_name = "example",

    sample_name = "sample_1",

    Pinus = NA_real_

  )

replace_missing_community_counts_with_zeros(

  data_community = data_community

)
```
