Scale Predictors with Training Attributes

Description

Applies scale centres and optional scale factors learned from training data to another predictor data frame without refitting the transformation.

Usage

```
scale_predictors_with_training_attributes(
  data_predictors = NULL,
  scale_attributes = NULL
)
```

Arguments

`data_predictors`	Data frame with row names and numeric predictor columns.
`scale_attributes`	Named list of scale attributes produced by 'scale_abiotic_for_fit()' or 'scale_spatial_for_fit()'.

Value

Data frame with the original row names and columns ordered as 'scale_attributes'.

Examples

```
data_predictors <-
  base::data.frame(temperature = base::c(8, 12))
scale_attributes <-
  base::list(
    temperature = base::list(
      "scaled:center" = 10,
      "scaled:scale" = 2
    )
  )
```

```
scale_predictors_with_training_attributes(
  data_predictors = data_predictors,
  scale_attributes = scale_attributes
)
```
