Score sjSDM Tuning Predictions

Description

Calculates compact held-out binomial tuning metrics from aligned observed and predicted matrices.

Usage

```
score_sjsdm_tuning_predictions(
  data_observed = NULL,
  data_predicted = NULL,
  object = NULL,
  data_test_input = NULL,
  epsilon = 1e-06
)
```

Arguments

`data_observed`	Binary numeric matrix of held-out observations.
`data_predicted`	Numeric matrix of held-out probabilities with matching dimensions and dimnames. Missing prediction dimnames inherit observation dimnames.
`object`, `data_test_input`	Optional fitted object and test input accepted for compatibility with the tuning-runner scoring callback. Marginal probability scoring ignores them.
`epsilon`	Probability clipping tolerance strictly between zero and '0.5'.

Value

One-row tibble with retained taxa, response-value count, total and per-response negative log likelihood, and macro AUC.
