Select a Stable sjSDM CV Calibration Budget

Description

Selects the smallest benchmark budget whose repeat-one winner is converged and stable at the next rung, then confirms that candidate in repeat two as either the exact winner or a practically equivalent candidate.

Usage

```
select_sjsdm_cv_calibration_budget(
  data_benchmark = NULL,
  rank_threshold = 0.95,
  relative_loss_tolerance = 0.02,
  n_folds_expected = 5L,
  require_repeat_two = TRUE
)
```

Arguments

`data_benchmark`	Candidate-fold benchmark table containing repeat, budget, fit, convergence, and normalized held-out loss columns.
`rank_threshold`	Minimum Spearman candidate-loss rank correlation. Defaults to '0.95'.
`relative_loss_tolerance`	Maximum relative winning-loss change between rungs and maximum relative gap above the repeat-two winner. Defaults to '0.02'.
`n_folds_expected`	Required fold coverage for every candidate and budget. Defaults to five.
`require_repeat_two`	Whether acceptance requires repeat-two practical equivalence.

Value

One-row accepted budget and stability-evidence tibble.

Examples

```
## Not run:

select_sjsdm_cv_calibration_budget(data_benchmark)

## End(Not run)
```
