Summarise Expected Genus Richness

Description

Sums predicted genus probabilities for each grid cell and age slice. The resulting value is expected genus richness, not a probability.

Usage

```
summarise_expected_genus_richness(
  data_predicted_long,
  value_column = "predicted_probability"
)
```

Arguments

`data_predicted_long`	Long prediction data with one row per grid cell, age, and taxon.
`value_column`	Character scalar naming the probability column to sum.

Value

A tibble with one row per grid cell and age, plus 'expected_genus_richness' and 'n_taxa'.

Examples

```
summarise_expected_genus_richness(
  tibble::tibble(
    grid_id = c(1, 1),
    coord_long = c(10, 10),
    coord_lat = c(50, 50),
    age = c(0, 0),
    taxon = c("A", "B"),
    predicted_probability = c(0.2, 0.3)
  )
```

)
