Summarise sjSDM Fold Metrics

Description

Aggregates fold-local sjSDM prediction metrics without pooling predictions from separately fitted models.

Usage

```
summarise_sjsdm_fold_metrics(data_fold_metrics = NULL)
```

Arguments

`data_fold_metrics`	Long metric table returned by [evaluate_sjsdm_fold_predictions()].

Details

Paired improvements use model-minus-null for Tjur R2 and AUC, and null-minus-model for log loss and Brier score. Calibration coefficients are summarised by source but are not converted to directional improvements.

Value

Named list containing 'data_source_summaries' and 'data_paired_improvements'. Both tables contain repeat-level fold-macro and observation-weighted estimates with fold, taxon, observation, and class coverage. Paired improvements are positive when the model is better than the prevalence null.

Examples

```
## Not run:

summarise_sjsdm_fold_metrics(

  data_fold_metrics = data_fold_metrics

)

## End(Not run)
```
