Summarise sjSDM Tuning Candidates

Description

Pools fold-level tuning metrics within each repeat and candidate while retaining structured completeness diagnostics.

Usage

```
summarise_sjsdm_tuning_candidates(data_tuning = NULL)
```

Arguments

`data_tuning`	Candidate-by-fold table returned by [run_sjsdm_tuning_candidates()].

Details

Candidate parameters, cross-validation strategy, and regularization source must be constant for a candidate within a repeat. Incomplete candidates are retained with summary status "incomplete" and missing aggregate metrics.

Value

Tibble with one row per repeat and candidate. Held-out negative log likelihood is summed across folds and divided by the total number of response values. Candidates are eligible only when every fold in the repeat has status "ok" and finite loss.

Examples

```
## Not run:

summarise_sjsdm_tuning_candidates(data_tuning = data_tuning)

## End(Not run)
```
