Validate Abiotic Interpolation Contract

Description

Validates that abiotic interpolation inputs use the deterministic interpolation contract and do not contain age-uncertainty routing artifacts.

Usage

```
validate_abiotic_interpolation_contract(
  data_source,
  grouping_variables = "dataset_name",
  age_variable_name = "age"
)
```

Arguments

`data_source`	A data frame containing abiotic data to interpolate.
`grouping_variables`	A character vector of column names that will be used to group interpolation. Must not include uncertainty iteration columns.
`age_variable_name`	Name of the age variable column used for interpolation. Must not be 'age_uncertainty'.

Details

Abiotic predictors must use deterministic sample ages. Age uncertainty is restricted to paleo community interpolation through [interpolate_paleo_community_with_age_uncertainty()]. This guard fails fast if uncertainty columns or uncertainty-routing arguments reach the abiotic path.

Value

The input 'data_source', invisibly, when the contract is valid.
