Validate Allowed Configuration Values

Description

Validates a non-empty, unique character vector against supported values.

Usage

```
validate_config_allowed_values(vec_values, argument_name, vec_supported_values)
```

Arguments

`vec_values`	Character vector supplied by a configuration caller.
`argument_name`	Single character string naming the validated argument.
`vec_supported_values`	Non-empty character vector of supported values.

Value

'NULL', invisibly. The function aborts when validation fails.
