Validate the Active Configuration Profile Selection

Description

Checks that the active profile is explicitly authorized for a runner.

Usage

```
validate_config_profile_selection(
  vec_allowed_roles = base::c("main", "smoke"),
  vec_allowed_statuses = "active",
  file = here::here("config.yml")
)
```

Arguments

`vec_allowed_roles`	Non-empty character vector of profile roles authorized by the caller. Production runners should retain the default 'c("main", "smoke")'.
`vec_allowed_statuses`	Non-empty character vector of profile statuses authorized by the caller. Production runners should retain the default '"active"'.
`file`	Path to the generated YAML configuration file.

Details

Base and archived profiles are never executable. Main and smoke profiles must also declare 'selectable: true'. Dedicated reference or one-time runners may explicitly authorize their role and status.

Value

The validated '_profile' metadata, invisibly.
