evaluate_binary_log_loss
<i>Evaluate Binary Log Loss</i>

Description

Calculates mean binary cross-entropy after clipping probabilities away from zero and one.

Usage

```
evaluate_binary_log_loss(  
  observed = NULL,  
  predicted_probability = NULL,  
  epsilon = 1e-06  
)
```

Arguments

observed	Numeric binary observation vector.
predicted_probability	Numeric predicted-probability vector aligned with 'observed'.
epsilon	Single numeric clipping tolerance strictly between zero and '0.5'. Defaults to '1e-6'.

Value

One-row tibble containing 'log_loss', 'metric_status', observation counts, prevalence, and the clipping tolerance. Valid one-class inputs retain a finite log loss because this metric does not require both classes.

Examples

```
evaluate_binary_log_loss(  
  observed = c(0, 1),  
  predicted_probability = c(0.25, 0.75)  
)
```
